Trucking Business Process Optimization Services

Our goal is to remove the infrastructure expense and most time-consuming tasks of designing and creating the data extraction and document archival process. Thus, creating an opportunity for business that need small batch data extraction and document archival to take advantage of the solution capabilities without the big price tag, enabling reduced costs and quicker access over manual data entry and paper storage. We will process data extraction for a one-time solution or on periodic basis. We are currently focused on extracting data from Handwritten or Handprinted Forms required by the Trucking Industry. We offer fixed price implementation in our secure Cloud-based environment based on the volume of images processed.

We have provided a high-performance, modern, Web-based automation system that significantly reduces the complexity and costs associated with document-based tasks such as document classification, separation, data entry and long term storage and retrieval of archived Driver's Daily Logs, Load/Trip Sheets, DOT Drug Tests and Driver's Vehicle Inspection Reports.

Our intelligent document automation solution for trucking features:

Mixed Document Capture

Our solution doesn't need separate configurations to manage mixed document streams that include structured, semi-structured and unstructured information. Even documents that mix structured and unstructured data can be processed simultaneously.

Dynamic Document Classification

Using a variety of deep learning neural networks, we determine document types dynamically without the need for rules, barcodes or separator pages. Including multiple classifiers that work independently on text and visual elements (with no OCR required), our solution uses every bit of available information to intelligently identify documents and detect document boundaries.

Any and All Data Types

We can locate any information on the page. This includes text, all types of handwriting including paragraphs and full pages, logos, tabular data and signatures or other "script." Also, it supports standard data such as OMR and 1D/2D barcodes.

Expansive Document Type Support

Process any type of document, including forms, invoices, remittances, mail and documents that do not match a pre-defined template. Smart Learning ensures that you achieve high levels of automation regardless of document layout.

Document Archive

All images and extracted metadata will be exported into the M-Files DMS for archiving, search and retrieval.

Everything in one place

We connect content such as documents, emails, customer details, order numbers, and project info, even if it is saved in different archives or systems.

A full context for your work

All contracts expiring next month, all documents for a given project, all correspondence with a customer. You get the full picture on the topic you are interested in.

One copy, no uncertainty

Forget duplicates, we store one copy for each document instead. Never again will you have to wonder if you are working with the most recent version.

We take care of the rest

We make sure documents go through their workflows, follow appropriate retention policy, and that documents are accessed only by those with the right permissions.

Document Retrieval

All documents will be retrievable by both assigned metadata and full text searches, from anywhere there is web access.
